

LABORATORY 12

EXAM SIMULATION

Lab 12

Solving the lab in the exam environment (Moodle + CrownLabs) is strongly suggested to become familiar with it

- Same procedure seen in Lab11
- The "Exam Simulation" quiz has been updated with lab12's questions.

- **Remember to use the empty main.py file, do not create extra files!**

Lab 12 – Peer Review #3

- In this lab, we will also have our last **Peer Review** session.
 - The exercise to submit is the programming one...
 - **Password:** jahierlab12

- The rules are always the same...
 - Be sure not to miss the deadlines (both for submitting your work and for reviewing the others')

Lab 12 – Peer Review #3

- **CAREFUL**: Remember that to submit your program for Peer Review, **you need to copy it** in submission box on Moodle

The screenshot shows a Moodle submission interface. On the left, there is a sidebar with a 'Submission' section containing 'Title' and 'Submission content' fields. The main area displays the submission form for 'Lab3 ex 3.2.2'. It features a text editor with a toolbar and a large text area. A red rectangular box is overlaid on the text area with the text 'Copy/paste your solution's code here.' Below the text area are 'Save changes' and 'Cancel' buttons. A 'Required' status is indicated at the bottom left of the form.

- **This is true in all cases**: if you solve it on your computer, the lab's computer, or using the Exam Simulation on Moodle.
- Remember: copy paste the code, do not attach files!
- See the Peer Review.pdf guide for any doubt.

Programming Exercise

- Read the request (carefully, this is often the main issue at the exam....!)
- As always, the first choice we have to make is **what data structure to use**.
How (and if...) we want to save the input files' content:
 - File *customers.txt*.
 - It is a «record file» (one record per row, with multiple fields)...
 - Can the same customer be present multiple times?
 - *On this, the request is not clear.... So start from the simplest assumption (no repeated customers)*
 - *Then, if you have time, try to extend it to the general case...*
 - File *suspects.txt*
 - Here, we can safely assume there are no duplicates...

Programming exercise

- **The algorithm is quite simple:**
 - For each suspect in *suspects.txt*:
 1. **Verify if he/she stayed at the hotel**
(otherwise, contacts cannot occur, and we can print a special message to signal it...)
 2. **Scan all customers (different from the suspect him/herself...) and compare the hotel stay intervals...**
 3. **If they **overlap** add them to a list**
(why can't I print them out immediately?)
 4. **Print the list (as requested!)**
- **Careful to:**
 - **Check input errors (are the files present?)**
 - **Always print results in the correct format.**
